

Business Risk Factors in Wood Construction from Design to Commissioning

<https://research.thinkwood.com/en/permalink/catalogue2326>

Organization: Université Laval

Research Status: In Progress

Notes: Project contact is Yan Cimon at Université Laval

Summary:

CIRCERB (Chaire industrielle de recherche sur la construction écoresponsable en bois) has in the past mapped decision-making in public construction projects in Quebec. Using the same mapping approach, the project will highlight the steps in carrying out a timber construction project to identify hot spots where risk is important to the proponent, taking into account all stakeholders (material suppliers, general contractors, specialized contractors, etc.). In addition to presenting a broad picture of the wood construction, the project will identify the elements of the value creation chain on which optimization of business practices would be beneficial for wood construction.
