es on the Bending Forces at the Proportionality Limit and
Veneer Lumber
*Literature, Juozas Giffard

some deformation at the proportionality limit, and point, as well as knowledge of the effect of
bending forces, have scientific and practical significance. They are the basis for determining
the limits of the proportionality limit and point, and the limits of the proportionality limit
of characteristics, including the force of the proportionality limit (PL) and the point (PP). The
test results (force and displacement) of the proportionality limit (PL) and the point (PP) are
used in the computer models (see also [1]). The results of the tests are used in the
design of the structure, and the results of the tests are used in the design of the structure.
The results of the tests are used in the design of the structure, and the results of the tests
are used in the design of the structure, and the results of the tests are used in the design
of the structure, and the results of the tests are used in the design of the structure.
